Quiz, 10 questions

### Congratulations! You passed!

Next Item

1/1 point

1.

Suppose your training examples are sentences (sequences of words). Which of the following refers to the  $j^{th}$  word in the  $i^{th}$  training example?

 $x^{(i) < j >}$ 

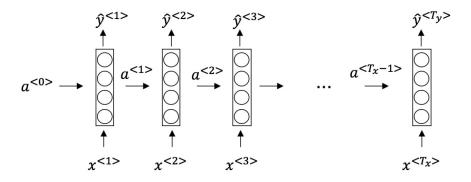

We index into the  $i^{th}$  row first to get the  $i^{th}$  training example (represented by parentheses), then the  $j^{th}$  column to get the  $j^{th}$  word (represented by the brackets).

- $x^{(j) < i>} \ x^{< j>(i)}$

Quiz, 10 questions

2.

Consider this RNN:

This specific type of architecture is appropriate when:

$$\bigcap T_x = T_y$$

It is appropriate when every input should be matched to an output.

$$T_x < T_y$$

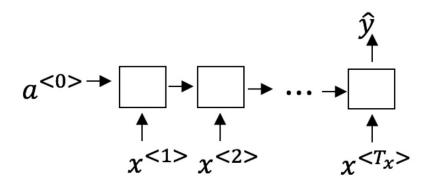

$$T_x > T_y$$
  $T_x = 1$ 

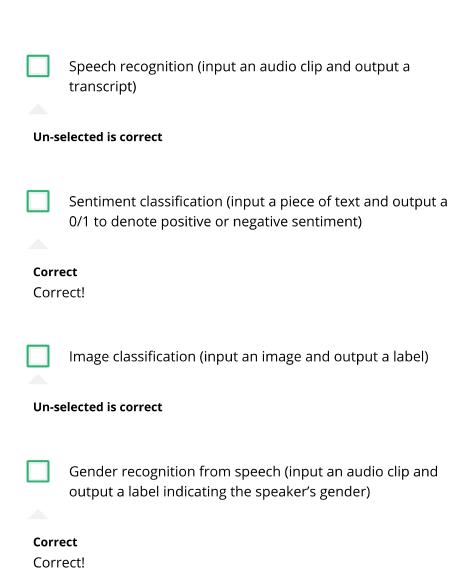

$$T_x = 1$$

Quiz, 10 questions

3.

To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

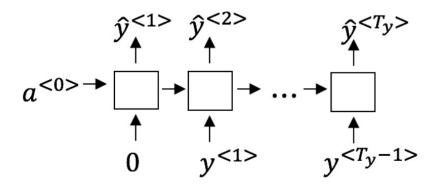

Quiz, 10 questions

4.

You are training this RNN language model.

At the  $t^{th}$  time step, what is the RNN doing? Choose the best answer.

- Estimating  $P(y^{<1>}, y^{<2>}, ..., y^{< t-1>})$
- $igcap ext{Estimating } P(y^{< t>})$
- Stimating  $P(y^{< t>} | y^{< 1>}, y^{< 2>}, ..., y^{< t-1>})$

### Correct

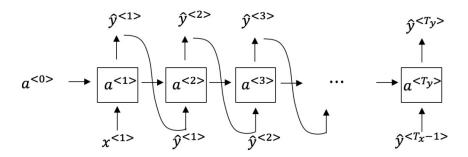

Yes, in a language model we try to predict the next step based on the knowledge of all prior steps.

Estimating  $P(y^{< t> | y^{< 1>}, y^{< 2>}, ..., y^{< t>})$ 

Quiz, 10 questions

5.

You have finished training a language model RNN and are using it to sample random sentences, as follows:

What are you doing at each time step t?

- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass the ground-truth word from the training set to the next time-step.
- (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass this selected word to the next time-step.
- (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as  $\hat{y}^{< t>}$ . (ii) Then pass this selected word to the next time-step.

Correct

Yes!

# Recurrent Neural Networks Quiz, 10 questions

10000

are all	e training an RNN, and find that your weights and activations taking on the value of NaN ("Not a Number"). Which of these is ost likely cause of this problem?
	Vanishing gradient problem.
0	Exploding gradient problem.
Corr	ect
	ReLU activation function g(.) used to compute g(z), where z is too large.
	Sigmoid activation function g(.) used to compute g(z), where z is too large.
<b>~</b>	1 / 1 point
and ar	se you are training a LSTM. You have a 10000 word vocabulary, e using an LSTM with 100-dimensional activations $a^{< t>}$ . What is nension of $\Gamma_u$ at each time step?
	1
0	100
	ect rect, $\Gamma_u$ is a vector of dimension equal to the number of len units in the LSTM.
	300

Quiz, 10 questions

8.

Here're the update equations for the GRU.

### **GRU**

$$\tilde{c}^{< t>} = \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[c^{< t-1>}, x^{< t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[c^{< t-1>}, x^{< t>}] + b_r)$$

$$c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>}$$

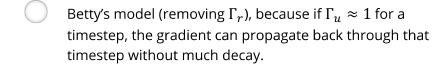

$$a^{< t>} = c^{< t>}$$

Alice proposes to simplify the GRU by always removing the  $\Gamma_u$ . I.e., setting  $\Gamma_u$  = 1. Betty proposes to simplify the GRU by removing the  $\Gamma_r$ . I. e., setting  $\Gamma_r$  = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

- Alice's model (removing  $\Gamma_u$ ), because if  $\Gamma_r \approx 0$  for a timestep, the gradient can propagate back through that timestep without much decay.
- Alice's model (removing  $\Gamma_u$ ), because if  $\Gamma_r \approx 1$  for a timestep, the gradient can propagate back through that timestep without much decay.
- Betty's model (removing  $\Gamma_r$ ), because if  $\Gamma_u \approx 0$  for a timestep, the gradient can propagate back through that timestep without much decay.

### Correct

Yes. For the signal to backpropagate without vanishing, we need  $c^{< t>}$  to be highly dependant on  $c^{< t-1>}$ .

Quiz, 10 questions

9.

Here are the equations for the GRU and the LSTM:

 $\begin{array}{lll} & & & & & & & & \\ \tilde{c}^{< t>} = \tanh(W_c [\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c) & & \tilde{c}^{< t>} = \tanh(W_c [a^{< t-1>}, x^{< t>}] + b_c) \\ & & & & & \\ \Gamma_u = \sigma(W_u [c^{< t-1>}, x^{< t>}] + b_u) & & & & \\ \Gamma_u = \sigma(W_u [a^{< t-1>}, x^{< t>}] + b_u) & & & \\ \Gamma_r = \sigma(W_r [c^{< t-1>}, x^{< t>}] + b_r) & & & & \\ \Gamma_f = \sigma(W_f [a^{< t-1>}, x^{< t>}] + b_f) & & \\ c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>} & & \\ c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>} \\ & & & \\ a^{< t>} = \Gamma_o * c^{< t>} \\ & & \\ a^{< t>} = \Gamma_o * c^{< t>} \\ \end{array}$ 

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to \_\_\_\_\_ and \_\_\_\_ in the GRU. What should go in the blanks?

$$\Gamma_u$$
 and  $1 - \Gamma_u$ 

### Correct

Yes, correct!

- $\Gamma_u$  and  $\Gamma_r$
- $1 \Gamma_u$  and  $\Gamma_u$
- $\bigcap$   $\Gamma_r$  and  $\Gamma_u$

Quiz, 10 questions

10.

You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as  $x^{<1>}$ , ...,  $x^{<365>}$ . You've also collected data on your dog's mood, which you represent as  $y^{<1>}$ , ...,  $y^{<365>}$ . You'd like to build a model to map from  $x\to y$ . Should you use a Unidirectional RNN or Bidirectional RNN for this problem?

	Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.
	Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.
0	Unidirectional RNN, because the value of $y^{< t>}$ depends only on $x^{<1>}$ ,, $x^{< t>}$ , but not on $x^{< t+1>}$ ,, $x^{< 365>}$
Corre Yes!	ect
	Unidirectional RNN, because the value of $y^{< t>}$ depends only on $x^{< t>}$ , and not other days' weather.
